

Will my older brackets fit my new 8R tractor?

Yes they will!

There are three modifications that need to be done.

1. A new hole needs to be drilled with a mag drill, 2" below the **TOP BACK HOLE** (see picture below) on each bracket. The steel gusset will need to be trimmed to accommodate the new hole.
2. The block that goes between the brackets, underneath the tractor, needs to be 5/8" wider. A new block is \$410 or you can simply add shims or washers to each side of the block for an added 5/8".
3. The top brace arms need to be replaced. A replacement set is \$650. The rod, nut, square washer, and remaining hardware can be reused.
